WELCOME TO OUR 35TH ANNUAL BULL SALE

Welcome to our Annual Glenoch Angus sale, this year being 35 years, along with Roger's 52 years of Angus Australia membership.

As time marches on, with significant changes in technology and industry, one common thread is the continuous breeding of Glenoch Angus cattle that are suitable for Northern Australian conditions.

This year our sale is 2 weeks later, so if you are keen to come to our sale, please remember the new date of Tuesday 18th August.

Each year we seek to find some of the leading genetics for our AI program, and our home-bred bulls to use for paddock sires over

the summer. Our home bred bulls are performing well and we have several sons in the sale by them.

Once again, our core values of producing bulls from cows that have stood the test of time in an environment that is compatible to Northern Australian conditions, has shown us we are on the right path. We have clients from different areas of Queensland who have given us very positive feedback on the results of Glenoch Angus progeny in their herd and at market. We present bulls each year that are in moderate condition, ready to go to work.

We cannot place enough emphasis on the importance of a good temperament in any herd and those animals that do not display a calm quiet disposition are removed from the Glenoch Angus program. This year, of the V drop bulls that were assessed for temperament by an independent assessor, over 98% of the bulls had a raw data score of 1, with the remaining 2% a score of 2, within the range of 1-5, 1 being very good temperament.

The sale kicks off with V152 sired by an EG Eyes Onyou son, T153. Eyes Onyou is a very well-bred sire by Hoover No Doubt, who we chose for his depth of body and natural shape with a focus on

Lot 1 Glenoch Tongon V152

growth traits and docility. T153, who has 5 sons in the sale.

It is pleasing to see the Hoover About It progeny, showing his desirable traits, calving ease, low birthweight, growth and fertility being carried on in the herd. Have a look in the catalogue for the Hoover About It sons if you are keen to look at bulls that have outstanding phenotype, good weight gain with strong stature and good topline.

We have been using Sterling Pacific for a couple of years and his progeny are very pleasing as they have added good growth and temperament to the herd. His progeny are phenotypically and structurally correct, with a presence about them.

Thank you to our extended team that make it possible for us to present bulls at the sale each year. Those that work with us, our valued friends and associates that come to

collect and measure data, animal health, marketing, and on sale day, as well as the businesses that provide us with the tools to make the business work. Also, thank you to our clients who have trusted us to provide the genetics for their herd. From on the ground at Glenoch Angus to travelling to deliver bulls, we have a lot of fun along the way as well, which makes it worthwhile.

The bulls will be available for inspection before the sale by arrangement and on the sale day from 10am. Good luck with your bull buying, and please get in contact with us if you would like more information.

Our website, social media and our online selling platform AuctionsPlus will be updated with relevant information as it is available, and we get closer to the sale day.

All the best

Roger & Tam Boshammer

Roger & Tam Boshammer

Tom has 6 bulls in the sale

Welcome from the Canaga Angus Team

Angus breeding runs very passionately in this little family and for some years now Tommy has wanted to continue pursuing the stud breeding with the aim of his own bull sale one day. He's very valuable contribution and it's nothing for him to help into the dark after school plus he has very good eye for quality cattle. He's always had old head on young shoulders so we will help him as best we can.

Since 2018 Canaga Angus has been purchasing their own sires for herd improvement with focus on thickness, power, feed efficiency, calving ease and fertility whilst trying maintain weight for age or better.

This year's and last year's crop of weaners are best ever - thick, square with very high fertility rates.

Texas Maverick R790 was purchased in 2022 and his influence has been remarkable, particularly from using his sons out of our best cows. This is where things have really taken off. Maverick is +10 EMA and +5 for IMF with extremely high calving ease and produces very fertile progeny that have been early matured and capable.

All the Canaga Bulls in this year's sale are by Maverick and we have used them all including over heifers.

We know these boys won't disappoint you as their older brothers and sisters have beautiful calves on the ground for not only us but in our clients herds as well. Enjoy!

Canaga Angus Team

SALE NOTES

Movement of Bulls

- No cattle tick clearance required.
- We are a J-BAS & herd, and our last sample test was 9 September 2025.

Insurance

From the fall of the hammer by arrangement. Michael from WFI will be present on the day and is also happy to talk to clients prior to, and post auction day, should they have any queries.

Michael Ball

M. 0467 763 087

E. michael.ball@wfi.com.au

Agent Rebate

Please send a letter of introduction to livestock.dalby@raywhite.com 4% commission will be paid to any agent:

- Accompanying a client to the sale or
- Attends the sale and purchases on a client's behalf
- Settling within 7 days

Bulls without EBV's

EBV's will be available online prior to the sale for those without EBV's.

Sale Day Phone

There is mobile coverage at the sale shed.

Handling

Glenoch cattle are used with dogs, horses and side-by-sides and we practice low stock handling principles.

Delivery

Delivery of your new bull is free in Queensland and will be coordinated by the Glenoch team. Please give clearly written delivery instructions and co-ordinate well in advance to ensure the transition of your bull to its new home is smooth. If you have your own transport, bulls will be available for collection on sale day.

Safety

All sale bulls have been selected for their desirable temperament and under normal conditions are quiet. However, on sale day, the bulls are exposed to different circumstances and can be unpredictable. To avoid risk of injury we ask that people entering the bull pens be aware and alert and watch for any bulls that may be playful or fight with each other. Please always be aware of the bulls when you are in the pens. Do not enter the pens if you are immobile or if you have children in your care.

Skipped lot data

Information on skipped lot numbers will be provided closer to the sale.

Directions

Glenoch is located 28km NE of Chinchilla, at 416 Burra Burri Creek Road. **From Dalby:** 60km on Warrego Hwy to Brigalow, turn right Brigalow-Canaga Road follow 22km, turn left Chinchilla-Wondai Rd follow 2km, turn right onto Burra Burri Creek Road, follow 4km, Glenoch is on the right.

From Chinchilla: Leave town on Chinchilla-Wondai Road (accessed by taking Cemetery Road off Warrego Hwy on eastern edge of town), follow 24km, turn left onto Burra Burri Creek Road, follow 4km, Glenoch is on the right. **Note:** Avoid using GPS for directions to Glenoch, as it tends to be unreliable.

T153 who is by EG Eyes Onyou is noted for body depth, natural shape, growth performance and docility. A very well-bred sire by Hoover No Doubt, who we chose for his depth of body and natural shape with a focus on growth traits and docility. T153 was one of the best performing yearlings for weight at 291 kg.

Hoover About it is an attractive low birthweight bull that is really long, big hipped, thick, with added muscle. His dam is a beautiful uddered, moderate cow with a 349-day calving interval, indicative of the superior fertility in his cow family. Great grandam, G366, is regarded as the best and most influential cow in Hoovers 95-year history.

A powerful son of Hoover No Doubt who has continued to take the world by storm, out of Breastmodes full flush sister. He is deep, stout, square made, structurally correct with a top-notch disposition. With all growth traits in the top 1.4 and 6%, he is a bull that will add performance with maternal strength coming from the famous Baldrige Isabel Y69, who needs no introduction. Sterling Pacific's temperament is top 2% and his progeny are very docile. We used him for his outstanding growth traits, performance, docility.

He is a Pheasant son we bought in partnership with Rob Williams and Chris King. Purchased for his very high IMF very good calving ease and maternal data. He is very good structurally and very easy fleshing bull. His Ebv's for birth weight, EMA and IMF are outstanding, all being in the top 3%. Unfortunately, we only have 1 son in the sale, and we have used him on cows. Lot 19 has good data for those traits as well.

THE GLENOCH ANGUS

✓ Natural Selection

An integral part of our breeding program is to place commercially relevant pressure on our females to calve unassisted as a two-year-old, get back in calf around 70 days later, wean a seven-month-old calf and continue the same process for many years to come.

A low cost system is important to us, not only for our bottom line, but also to be commercially relevant to our customers. Fertility is so important in a breeding operation and the biggest fallout of unproductive breeders is likely to occur from joining as a yearling to joining as a three-year-old. Therefore, regardless of EBV or pedigree, this process ensures the bulls we sell have generations of proven fertility under a low cost environment.

Some operations like to wean earlier which can allow producers to run higher maintenance cows, but for mine, the weaning weight is the gross return for the capital invested in the cow. Most years we wean at an average age of seven months to aim at an average weaning weight of 270kg-300kg. Our calves are mostly born in late August and September, and by weaning in April

it allows time for the cow to build up fat reserves and the weaners adjust to a grass diet before the frosts hit.

We also weigh the cows at weaning and ideally we like to see an average weaning weight efficiency around 47%-50% (calf weight/cow weight x 100).

For many years we have been providing the number of calves and average calving interval data for all the mothers of the bulls we sell. This data aims to objectively prove the fertility of our cows.

✓ Bull Preparation

On sale day, the age of the two-year-old bulls will range from 645-740 days, and we like them to have an average sale weight of 730-750kg. So when their birth weight is subtracted from this, they need to achieve a lifetime gain of roughly 1kg/day.

Our bulls are ideally developed on oats through the winter, and leucaena and grass throughout the rest of the year to ensure they adapt and thrive in their new environments.

By sale time we aim to have our bulls in a presentable condition to adequately show their potential and prepare them for the up-

coming joining season without the detrimental effects of overfeeding.

Sudden changes in environment and nutrition can affect semen quality and therefore we have found our bull preparation method to be highly beneficial to the longevity of the bulls and the conception rates of the purchasers' cows.

More often than not we hear our bulls keep gaining weight in their new environments as opposed to the 'let down' period of overfed bulls.

In particularly dry years we do supplement them to reach the required condition as under conditioned bulls can also negatively affect performance.

✓ Genetics for your requirements

We have been performance recording since 1986 and in that time we have aimed to get the balance right between the traits that EBVs do and don't measure.

EBVs have been a great tool for beef production as they measure most of the important traits. The Angus breed has progressed significantly, and while for many years it was difficult to breed numbers of cattle that excelled for every trait, the gap is now narrowing considerably.

ANGUS ADVANTAGE

Performance has also now shifted so much that high performance does not mean optimum performance, and therefore different environments, management and herds will require different levels. Through our years of observation and measurement we have been able to successfully advise customers which levels may suit, so feel free to ask.

We now also incorporate genomic data into the EBVs, and this increased accuracy gives greater confidence to use the EBVs when making broad, pre-auction bull selections before visually assessing their type.

As mentioned, EBVs don't measure every trait and they don't consistently measure the type of animal many producers have come to appreciate. Nevertheless, one cannot focus solely on type at the risk of jeopardising function. We have certainly experienced good looking cows preg-testing empty and rough looking cows weaning heavy calves and early in calf. Function is a non-negotiable in our herd, with a balance of EBVs and type.

While we aim to be multi-trait, we have aimed to increase marbling as much as we can. We can't argue that we get paid on weight, and that

gross income is largely driven by kg/ha and fertility rates. However, the Angus premium is largely attributed to marbling levels and some Angus cattle are now marbling competitively against Wagyu, with better conversions and growth, and no horns. Technology is rapidly improving and value based marketing is not that far away. Marbling has a distinct premium for the end consumer, because the eating quality improves.

Quality Assured

From pedigrees to performance data to vaccinations and breeding soundness, we do our very best to assure all customers that their purchases are true and correct. All seedstock animals are registered with their respective breed societies and we have been utilising Breedplan technology since 1986.

By sale time all bulls are tested free of Pestivirus, blooded for tick fever and vaccinated against vibriosis, 3-day sickness (epimeral fever), leptospirosis, IBR and 5-in-1.

All sale bulls are backed by a three year breeding guarantee (subject to the Glenoch Guarantee) and to take part in our annual bull sale they must pass their semen motility and morphology test. They're also DNA sire verified.

Beef breeding is a slow game and purchasing new bulls is a significant investment both short and long term. That's why it pays to select seedstock suppliers who are closely aligned to the commercial world, those that measure performance and carry out all the tests and vaccinations to ensure productive progeny from the bulls purchased.

Customer Satisfaction

We do our very best to please our customers and we take a holistic approach to ensure our bulls get the job done and sire the type of progeny required. We work with a number of producers to help select bulls and also provide recommendations on breeding management.

We've been breeding bulls for over 50 years and selling to all different parts of the country, and it is this experience that has enabled us to understand the many different environments and management producers work with.

Our breeding program is an open book, so we encourage all new and existing customers to inspect our herd and ask any questions. Simply, we aim to deliver bulls that work!

HEALTH AND FERTILITY

Health

All bulls have been:

- Blooded for tick fever
- Tested free of pestivirus
- Vaccinated for lepto, 5 in 1, 3 day, vibrio and Bovilis MH+IBR

Fertility

There are three parts to our fertility test:

- 1. Physical** - The bulls are examined for structural soundness. Special note is taken of joints and feet. Only bulls with sound joints and good feet are offered for sale.
- 2. Testicles** - The testicles are held firmly at the bottom of the scrotum and the circumference measured. Scrotal circumference gives an indication of the amount of semen that a bull is producing. Up to a point, the bigger the testicles, the better. Bulls with a circumference of less than 30cm usually have poor fertility and should not be used. The testicles are then felt and the tone evaluated. They should be firm and springy. Bulls with firm, springy testicles are almost always producing good quality semen. Very soft testicles produce poor semen. The semen delivery system is then palpated to make sure the semen is getting through the penis.
- 3. Semen Testing** - All bulls have been semen and morphology tested to quality assure your investment. The fertility testing has been carried out by vet Dr Ced Wise of Ced Wise AB Services Pty Ltd. Scrotal measurements and semen test results available on sale day.

The Glenoch Guarantee

All Sandon Glenoch Angus sale bulls come with a three-year breeding soundness guarantee from the time of sale. Any claim against the breeding ability of any Glenoch bull purchased must be made in writing and accompanied by a veterinary certificate from an approved veterinarian. All costs shall be borne by the purchaser. If, during the three years after purchase, an Glenoch

bull becomes infertile, develops premature spiral deviation or breaks down, provided it is not caused by injury or disease contracted after leaving Glenoch, we will;

- a. Replace the bull with as close a match as possible; or
- b. grant a full credit for any purchase at Glenoch sales.

This is compensated on a pro-rata basis minus any salvage value of your bull. This guarantee is NOT a life insurance policy. We recommend you insure animals against injury (loss of use) and death.

It is not recommended to semen test your bull if his body condition is lower than body score 3 as there is a relationship between semen quality and body condition and as many bulls come in from their mating season in working condition, sometimes they may underweight which adversely affects the quality of semen.

Research (Bull Power Project, Fordyce et al) has identified that when the body condition of bulls reduced from prime to between store and poor condition, scrotal circumference and percent normal sperm reduced by an average of 2.5 cm and 30% respectively

The good news is that this effect is reversed with a return of good nutrition.

We wish our bulls to do a good job of taking care of your business at joining time and if you have any problems, please contact us.

Fordyce & Kenneally (The Bull BCS and semen quality project) has more information and can be found on our website.

Penile Infections in Bulls

(Balanoposthitis, Granular Posthitis)

Penile infections are a common disorder in young bulls in their first joining season following introduction to a new herd.

A range of bacterial, viral and other organisms ("bugs") cause these infections with the most common being the genital form of infectious bovine rhinotracheitis (IBR) virus.

Any given property has its own population of "bugs" and if the

new bulls have had no exposure previously to these "bugs" they will likely develop a penile infection early on in the joining.

These penile infections can be severe with the bulls developing a reddened inflamed penis, often with pustules or ulceration on the surface, and will stop the bull serving due to pain.

If bulls with active infection are detected (red and inflamed penis) they should be isolated from females and treated with antibiotics and anti inflammatory medication.

Oxytetracycline antibiotic therapy is the treatment of choice.

In some cases, penile infections can cause extensive swelling in the prepuce and the condition can look like the bull has a broken penis or sheath injury. These bulls if treated promptly may regain normal function.

Penile infections are transient and bulls usually recover after 3-4 weeks. If undetected this type of disorder can cause a huge decrease in conception rate and possible permanent infertility in the bull in a small percentage of cases.

Affected bulls may continually mount cows without serving. A sound healthy bull should serve on every 1 or 2 mounts.

Pre exposure of the bulls by joining them to a small number of females well before the normal joining is one method of ensuring young bulls have maximum immunity to the "bugs" on a property.

Achieving satisfactory pregnancy rates is essential in running a profitable beef enterprise.

For this reason the joining period is one of the most critical periods of the year.

The bulls and cows need to be observed regularly in this period to identify any problems and address them as soon as possible.

It is also advisable to pregnancy test 6 to 8 weeks following joining to ensure satisfactory pregnancy rates have been reached.

Andrew Todd BVSc
Holbrook Cattle Vets

CARING FOR YOUR NEW BULL

1. Receiving/settling in - A

bull leaving Glenoch is leaving the security of a large mob of mates and will arrive in a strange environment at your property. The truck ride to your property can sometimes be a little distressing, especially on his own. Unload him and make sure he has a cow or a steer as company straight away, in a secure yard, if you can't put him in the bull mob immediately. A young bull can move in with older bulls and settle in quite well but remember that, being the youngest, he will get the last of any supplementary feed if available, because of the dominance of older bulls. The paddock is best to be of reasonable area to allow him to keep away from the others.

2. Handling - Respect your bulls and handle them quietly, allow them to walk rather than rushing. Treat them with care and in a gentle but firm manner and they will do likewise to you. Our bulls are handled on horseback, motorbike and dogs. The bulls have been educated with electric fences and well as 4 barbed fences, as they are mostly restrained with electric fencing.

3. Maintenance checks - Your new bull is an investment in the future of your business and is no different to a vehicle or tractor which needs fuel to keep it going and regular checks to the oil and water. This bull will give his best to your business if he has had enough food to maintain the performance required at the time and keep a check on his working

gear throughout the joining season. After his first season he will need to be conditioned up prior to the next season, if you don't have access to a suitable pasture for him to regain weight, a little protein meal will help. The cost of some meal is more than offset by having him at peak performance for joining to achieve maximum early conception from your herd. Just like you would do with your tractor before planting.

4. Animal Health - All calves at Glenoch are vaccinated twice with 7-in-1 and then receive a booster just prior to the sale. They are also vaccinated for vibrio and 3-day sickness and blooded for tick fever. We suggest that they be given a booster vibrio and 3 day. If you look after them they come well equipped and eager to look after your business.

5. Mating - Most well grown Angus bulls will handle up to 50 females in a joining season but this will depend upon the environmental conditions and management. We have had reports of our bulls handling considerably more. Young bulls should not be left in with the cows and forgotten about as they do lose teeth at around two years of age. If you multiple join bulls it is best not to mix young bulls with older bulls as they will be socially dominated, and at risk of injury, thereby reducing their contribution to your calf crop.

6. General bull management - During the joining season while it is the bull's job to get the calves,

a little observation of your bulls in action can be of advantage in early identification of injury. If a bull does not behave in a normal manner serving, he must be replaced that day and checked out. Should a cow have been served prior to an observer arriving, the bull may not repeat the performance with her. This is no call for alarm as some bull will move off and seek another active female after serving a cow. Bulls have been known to scratch their penis on dry manure on the butt of the cow, or an object in the paddock. Infection can set in a very large and alarming appendage can form. If treated in the early stages your bull's future can be restored and he can be back on the job. This will not apply to a broken penis but a lot of suspected broken penis injuries are just an infection unnoticed.

7. Between seasons - After the joining season attend to his health requirements and put him away in a soundly fenced paddock with enough food to keep him in good order. Adequate food will eliminate some of the fighting, thereby reducing the risk of injury. Always handle your bulls with respect and kindness. You will find that they will return your consideration back to you. Every attempt is made to ensure that no stock with bad dispositions are retained here in our breeding herds. Therefore, you can be assured that with sensible handling our bulls have a respectful attitude towards humans.

RECESSIVE GENETIC CONDITIONS

This is information for bull buyers about the undesirable genetic conditions, Arthrogryposis Multiplex (AM), Neuropathic Hydrocephalus (NH), ConTRACTIONtural Arachnodactyly (CA) and Developmental Duplications (DD).

Putting Undesirable Genetic Recessive Conditions in Perspective:

All animals, including humans, carry single copies (alleles) of undesirable or “broken” genes. In single copy form, these undesirable alleles usually cause no harm to the individual. But when animals carry 2 copies of certain undesirable or “broken” alleles it often results in bad consequences. Advances in genomics have facilitated the development of accurate diagnostic tests to enable the identification and management of numerous undesirable or “broken” genes. Angus Australia is proactive in providing its members and their clients with relevant tools and information to assist them in the management of known undesirable genes and our members are leading the industry in their use of this technology.

Key Point: With today’s DNA tools, undesirable genetic conditions can be managed!

What are AM, NH, CA and DD?

AM, NH, CA and DD are all recessive conditions caused by “broken” alleles within the DNA of individual animals. When a calf inherits 2 copies of the AM or NH alleles their development is so adversely affected that they will be still-born.

In other cases, such as CA and DD, calves carrying 2 copies of the broken allele may reach full-term. In such cases the animal may either appear relatively normal, or show physical symptoms that affect their health and/or performance.

Key Point: The number of reported observations of AM, NH, CA and DD calves is very low and there is certainly no need for panic.

How are the conditions inherited?

Research in the U.S. and Australia indicates that AM, NH, CA and DD are simply inherited recessive conditions. This means that a single gene (or pair of alleles) controls the condition. For this mode of inheritance two copies of the undesirable allele need to be present before the condition is seen; in which case you may get an abnormal calf. A more common example of a trait with a simple recessive pattern of inheritance is black and red coat colour. Animals with only one copy of the undesirable allele (and one copy of the normal form of the allele) appear normal and are known as “carriers”.

What happens when carriers are mated to other animals?

Carriers, will on average, pass the undesirable allele to a random half (50 %) of their progeny. When a carrier bull and carrier cow is mated, there is a 25% chance that the resultant calf will inherit two normal alleles, a 50% chance that the mating will result in a carrier (i.e. with just 1 copy of the undesirable allele, and a 25% chance that the calf will inherit two copies of the undesirable gene.

If animals tested free of the undesirable gene are mated to carrier animals the condition will not be expressed at all. All calves will appear normal, but approximately half (50%) could be expected to be carriers.

Key Point: For the condition to be expressed the undesirable gene needs to be present on both sides of the pedigree and both the sire and dam need to be a carrier.

How is the genetic status of animals reported?

DNA-based diagnostic tests have been developed which can be used to determine whether an individual animal is either a carrier or free of the alleles resulting in AM, NH, CA or DD.

Angus Australia uses advanced software to calculate the probability of (untested) animals to being carriers of AM, NH, CA or DD. The software uses the test results of any relatives in the calculations and the probabilities may change as new results for additional animals become available.

The genetic status of animals is being reported using five categories:

AMF:	Tested AM free
AMFU:	Based on pedigree AM free Animal has not been tested
AM _%:	_% probability the animal is an AM carrier
AMC:	Tested AM-Carrier
AMA:	AM-Affected

For NH, CA and DD, simply replace AM in the above table with NH, CA or DD.

Registration certificates and the Angus Australia web-database display these codes. This information is displayed on the animal details page and can be accessed by conducting an “Animal Search” from the Angus Australia website or looking up individual animals listed in a sale catalogue.

Key Point: The genetic status of an animal is subject to change and will be reanalysed and adjusted each week as DNA test results of relatives are received.

Implications for Commercial Producers:

Your decision on the importance of the genetic condition status of replaCE Dtrent bulls should depend on the genetics of your cow herd (which bulls you previously used) and whether some female progeny will be retained or sold as breeders.

Most Angus breeders are proactive and transparent in managing known genetic conditions, endeavouring to provide the best information available. The greatest risk to the commercial sector from undesirable genetic recessive conditions comes from unregistered bulls with unknown genetic background. The genetic condition testing that Angus Australia seedstock producers are investing in provides buyers of registered Angus bulls with unmatched quality assurance.

For further information contact Angus Australia’s Breed Development and Innovation Manager on (02) 6773 4602

STRUCTURAL SOUNDNESS SCORING

Structural soundness scores for TACE are collected using the Beef Class Structural Assessment System.

Scores are collected for traits related to feet and leg structure using a 1 – 9 scoring system, where:

- A score of 5 is considered ideal.
- Scores of 4 and 6 show slight variation from ideal, but this includes most animals. Any animal scoring 4 and 6 would be acceptable in any breeding program.
- Scores of 3 and 7 show greater variation, but would be acceptable in most commercial breeding programs, however seedstock producers should be wary.
- Scores of 2 and 8 are low scoring animals and should be looked at carefully before purchasing.
- Scores of 1 and 9 should be considered culls.

Structural soundness scores for TACE must be collected by an accredited technician. We have used Roger Evans, Bovine Scanning Services (Accreditor Number: 1018).

In this catalogue we have provided the raw data on each bull, in a table as follows:

Front Claw Set ➡		F	5		R	5	← Rear Claw Set
Front Feet Angle ➡		F	6		R	5	← Rear Feet Angle
Rear Leg Side View ➡			5			6	← Rear Leg Side View

Understanding the TransTasman Angus Cattle Evaluation (TACE)

What is the TransTasman Angus Cattle Evaluation?

The TransTasman Angus Cattle Evaluation is the genetic evaluation program adopted by Angus Australia for Angus and Angus influenced beef cattle. The TransTasman Angus Cattle Evaluation uses Best Linear Unbiased Prediction (BLUP) technology to produce Estimated Breeding Values (EBVs) of recorded cattle for a range of important production traits (e.g. weight, carcase, fertility).

The TransTasman Angus Cattle Evaluation is an international genetic evaluation and includes pedigree, performance and genomic information from the Angus Australia and Angus New Zealand databases, along with selected information from the American and Canadian Angus Associations.

The TransTasman Angus Cattle Evaluation utilises a range of genetic evaluation software, including the internationally recognised BLUPF90 family of programs, and BREEDPLAN® beef genetic evaluation analytical software, as developed by the Animal Genetics and Breeding Unit (AGBU), a joint institute of NSW Agriculture and the University of New England, and Meat and Livestock Australia Limited (MLA).

What is an EBV?

An animal's breeding value can be defined as its genetic merit for each trait. While it is not possible to determine an animal's true breeding value, it is possible to estimate it. These estimates of an animal's true breeding value are called EBVs (Estimated Breeding Values).

EBVs are expressed as the difference between an individual animal's genetics and a historical genetic level (i.e. group of animals) within the TACE genetic evaluation, and are reported in the units in which the measurements are taken.

Using EBVs to Compare the Genetics of Two Animals

TACE EBVs can be used to estimate the expected difference in the genetics of two animals, with the expected difference equating to half the difference in the EBVs of the animals, all other things being equal (e.g. they are joined to the same animal/s).

For example, a bull with a 200 Day Growth EBV of +60 would be expected to produce progeny that are, on average, 10 kg heavier at 200 days of age than a bull with a 200 Day Growth EBV of +40 kg (i.e. 20

kg difference between the sire's EBVs, then halved as the sire only contributes half the genetics).

Or similarly, a bull with an IMF EBV of +3.0 would be expected to produce progeny with on average, 1% more intramuscular fat in a 400 kg carcase than a bull with a IMF EBV of +1.0 (i.e. 2% difference between the sire's EBVs, then halved as the sire only contributes half the genetics).

Using EBVs to Benchmark an Animal's Genetics with the Breed

EBVs can also be used to benchmark an animal's genetics relative to the genetics of other Angus or Angus infused animals recorded with Angus Australia.

To benchmark an animal's genetics relative to other Angus animals, an animal's EBV can be compared to the EBV reference tables, which provide:

- the breed average EBV
- the percentile bands table

The current breed average EBV is listed on the bottom of each page in this publication, while the current EBV reference tables are included at the end of these introductory notes.

For easy reference, the percentile band in which an animal's EBV ranks is also published in association with the EBV.

Considering Accuracy

An accuracy value is published with each EBV, and is usually displayed as a percentage value immediately below the EBV.

The accuracy value provides an indication of the reliability of the EBV in estimating the animal's genetics (or true breeding value), and is an indication of the amount of information that has been used in the calculation of the EBV.

EBVs with accuracy values below 50% should be considered as preliminary or of low accuracy, 50-74% as of medium accuracy, 75-90% of medium to high accuracy, and 90% or greater as high accuracy.

Description of TACE EBVs

EBVs are calculated for a range of traits within TACE, covering calving ease, growth, fertility, maternal performance, carcase merit, feed efficiency and structural soundness. A description of each EBV included in this publication is provided on the following page.

UNDERSTANDING ESTIMATED BREEDING VALUES (EBVS)

Calving Ease/Birth	CEDir	%	Genetic differences in the ability of a sire's calves to be born unassisted from 2 year old heifers.	Higher EBVs indicate fewer calving difficulties in 2 year old heifers.
	CEDtrs	%	Genetic differences in the ability of a sire's daughters to calve unassisted at 2 years of age.	Higher EBVs indicate fewer calving difficulties in 2 year old heifers.
	GL	days	Genetic differences between animals in the length of time from the date of conception to the birth of the calf.	Lower EBVs indicate shorter gestation length.
	BW	kg	Genetic differences between animals in calf weight at birth.	Lower EBVs indicate lighter birth weight.
Growth	200 Day	kg	Genetic differences between animals in live weight at 200 days of age due to genetics for growth.	Higher EBVs indicate heavier live weight.
	400 Day	kg	Genetic differences between animals in live weight at 400 days of age.	Higher EBVs indicate heavier live weight.
	600 Day	kg	Genetic differences between animals in live weight at 600 days of age.	Higher EBVs indicate heavier live weight.
Maternal	MCH	cm	Genetic differences between animals in the height of mature females.	Higher EBVs indicate taller mature females.
	MBC	score	Genetic differences between animals in the body condition of mature females.	Higher EBVs indicate more body condition of mature females.
	MCW	kg	Genetic differences between animals in live weight of cows at 5 years of age.	Higher EBVs indicate heavier mature weight.
	Milk	kg	Genetic differences between animals in live weight at 200 days of age due to the maternal contribution of its dam.	Higher EBVs indicate heavier live weight.
Fertility	DtC	days	Genetic differences between animals in the time from the start of the joining period (i.e. when the female is introduced to a bull) until subsequent calving.	Lower EBVs indicate shorter time to calving.
	SS	cm	Genetic differences between animals in scrotal circumference at 400 days of age.	Higher EBVs indicate larger scrotal circumference.
Carcase	CWT	kg	Genetic differences between animals in hot standard carcase weight at 750 days of age.	Higher EBVs indicate heavier carcase weight.
	EMA	cm ²	Genetic differences between animals in eye muscle area at the 12/13th rib site in a 400 kg carcase.	Higher EBVs indicate larger eye muscle area.
	Rib Fat	mm	Genetic differences between animals in fat depth at the 12/13th rib site in a 400 kg carcase.	Higher EBVs indicate more fat.
	P8 Fat	mm	Genetic differences between animals in fat depth at the P8 rump site in a 400 kg carcase.	Higher EBVs indicate more fat.
	RBV	%	Genetic differences between animals in boned out saleable meat from a 400 kg carcase.	Higher EBVs indicate higher yield.
	IMF	%	Genetic differences between animals in intramuscular fat (marbling) at the 12/13th rib site in a 400 kg carcase.	Higher EBVs indicate more intramuscular fat.
Feed/Temp.	NFI-F	kg/day	Genetic differences between animals in feed intake at a standard weight and rate of weight gain when animals are in a feedlot finishing phase.	Lower EBVs indicate more feed efficiency.
	Doc	%	Genetic differences between animals in temperament.	Higher EBVs indicate better temperament.
Structure	Claw Set	score	Genetic differences in claw set structure (shape and evenness of claws).	Lower EBVs indicate less curl of the claw set.
	Foot Angle	score	Genetic differences in foot angle (strength of pastern, depth of heel).	Lower EBVs indicate more heel depth.
	Leg Angle	score	Genetic differences in rear leg structure when viewed from the side (angle at front of the hock).	Lower EBVs indicate a less angular leg angle.
Selection Index	\$A	\$	Genetic differences between animals in net profitability per cow joined in a typical commercial self replacing herd using Angus bulls. This selection index is not specific to a particular market end-point, but identifies animals that will improve overall net profitability in the majority of commercial, self replacing, grass and grain finishing beef production systems.	Higher selection indexes indicate greater profitability.
	\$A-L	\$	The \$A-L index is similar to the \$A index but is modelled on a production system where feed is surplus to requirements for the majority of the year, or the cost of supplying additional feed when animal feed requirements increase is low. While the \$A aims to maintain mature cow weight, the \$A-L does not aim to limit the increase in mature cow weight as there is minimal cost incurred if the feed maintenance requirements of the female breeding herd increase as a result of selection decisions.	Higher selection indexes indicate greater profitability.

UNDERSTANDING ESTIMATED BREEDING VALUES (EBVS)

Selection Indexes	\$D	\$	Genetic differences between animals in net profitability per cow joined in a commercial self replacing herd targeting the domestic supermarket trade. Steers are either finished using pasture, pasture supplemented by grain, or grain (e.g. 50 -70 days) with steers assumed to be slaughtered at 510kg live weight (280kg carcass weight with 12mm P8 fat depth) at 16 months of age.	Higher selection indexes indicate greater profitability.
	\$D-L	\$	The \$D-L index is similar to the \$D index but is modelled on a production system where feed is surplus to requirements for the majority of the year, or the cost of supplying additional feed when animal feed requirements increase is low. While the \$D aims to maintain mature cow weight, the \$D-L does not aim to limit the increase in mature cow weight as there is minimal cost incurred if the feed maintenance requirements of the female breeding herd increase as a result of selection decisions.	Higher selection indexes indicate greater profitability.
	\$GN	\$	Genetic differences between animals in net profitability per cow joined in a commercial self replacing herd targeting pasture grown steers with a 250 day feedlot finishing period for the grain fed high quality, highly marbled markets. Steers are assumed to be slaughtered at 800 kg live weight (455 kg carcass weight with 30 mm P8 fat depth) at 24 months of age, with a significant premium for steers that exhibit superior marbling.	Higher selection indexes indicate greater profitability.
	\$GN-L	\$	The \$GN-L index is similar to the \$GN index but is modelled on a production system where feed is surplus to requirements for the majority of the year, or the cost of supplying additional feed when animal feed requirements increase is low. While the \$GN aims to maintain mature cow weight, the \$GN-L does not aim to limit the increase in mature cow weight as there is minimal cost incurred if the feed maintenance requirements of the female breeding herd increase as a result of selection decisions.	Higher selection indexes indicate greater profitability.
	\$GS	\$	Genetic differences between animals in net profitability per cow joined in a commercial self replacing herd targeting pasture finished steers. Steers are assumed to be slaughtered at 650 kg live weight (350 kg carcass weight with 12 mm P8 fat depth) at 22 months of age. Emphasis has been placed on eating quality and tenderness to favour animals that are suited to MSA requirements.	Higher selection indexes indicate greater profitability.
	\$GS-L	\$	The \$GS-L index is similar to the \$GS index but is modelled on a production system where feed is surplus to requirements for the majority of the year, or the cost of supplying additional feed when animal feed requirements increase is low. While the \$GS aims to maintain mature cow weight, the \$GS-L does not aim to limit the increase in mature cow weight as there is minimal cost incurred if the feed maintenance requirements of the female breeding herd increase as a result of selection decisions.	Higher selection indexes indicate greater profitability.
	\$PRO	\$	Genetic differences between animals in net profitability per cow joined in a commercial self replacing herd based in New Zealand that targets the production of grass finished steers for the AngusPure programme. Steers are assumed marketed at approximately 530 kg live weight (290 kg carcass weight with 10 mm P8 fat depth) at 20 months of age, with a significant premium for steers that exhibit superior marbling.	Higher selection indexes indicate greater profitability.
	\$T	\$	Genetic difference between animals in net profitability per cow joined in a situation where Angus bulls are being used as a terminal sire over mature breeding females and all progeny, both male and female, are slaughtered. The Angus Terminal Sire Index focusses on increasing growth, carcass yield and eating quality. Daughters are not retained for breeding and therefore no emphasis is given to female fertility or maternal traits.	Higher selection indexes indicate greater profitability.

The suffix displayed at the end of each animal's name indicates the DNA parentage verification that has been conducted by Angus Australia. PV: Both parents have been verified by DNA. SV: The sire has been verified by DNA. DV: The dam has been verified by DNA. #: DNS verification has not been conducted. E: DNA verification has identified that the sire and/or dam may possibly be incorrect, but this cannot be confirmed conclusively.

NOTES

Glenoch Angus uses the Volvo truck purchased from WTG for on-farm operations and bull deliveries.

With You For The Long Haul

VOLVO

Western Truck Group (WTG) is the home of parts, sales and service for Volvo, UD and Mack trucks for the greater part of Queensland, the Northern Territory and the Dubbo area of New South Wales.

With branches in Toowoomba, Mount Isa, Darwin, Cairns, Townsville, Mackay, Rockhampton, the Sunshine Coast and Dubbo, and additionally supported by a strong network of 20 regional Customer Service Centres, WTG has the transport needs of its customers well and truly covered.

If you're in the market for a new truck, or need parts or service, give our knowledgeable and friendly team a call today!

Attention Buyer

Animal details included in this catalogue, including but not limited to pedigree, DNA information, Estimated Breeding Values (EBVs) and Index values, are based on information provided by the breeder or owner of the animal. Whilst all reasonable care has been taken to ensure that the information provided in this catalogue was correct at the time of publication, Angus Australia will assume no responsibility for the accuracy or completeness of the information, nor for the outcome (including consequential loss) of any action taken based on this information.

Parent Verification Suffixes

The animals listed within this catalogue including its pedigree, are displaying a Parent Verification Suffix which indicates the DNA parent verification status that has been conducted on the animal. The Parent Verification Suffixes that will appear at the end of each animal's name.

The suffix displayed at the end of each animal's name indicates the DNA parentage verification that has been conducted by Angus Australia.

PV: both parents have been verified by DNA.

SV: the sire has been verified by DNA.

DV: the dam has been verified by DNA.

#: DNA verification has not been conducted.

E: DNA verification has identified that the sire and/or dam may possibly be incorrect, but this cannot be confirmed conclusively.

Privacy Information

In order for Angus Australia to process the transfer of a registered animal in this catalogue, the vendor will need to provide certain information to Angus Australia and the buyer consents to the collection and disclosure of that information by Angus Australia in certain circumstances. If the buyer does not wish for his or her information to be stored and disclosed by Angus Australia, the buyer must complete the form included below and forward it to Angus Australia. If the form is not completed, the buyer will be taken to have consented to the disclosure of such information.

Buyers option to opt out of disclosing personal information to Angus Australia

If you do not complete this form, you will be taken to have consented to Angus Australia using your name, address and phone number for the purposes of effecting a change of registration of the animal(s) that you have purchased, maintaining its database and disclosing that information to its members on its website.

I, the buyer of animals with the following ids _____

from member _____ (name) do not consent to Angus Australia using my name address and phone number for the purposes of effecting a change of registration of the animals I have mentioned above that I have purchased, maintaining its database and disclosing that information to its members on its website.
